Offer Corporate co-operation, firm cooperation

Renewable energy

Start-Up with an award-winning Team of experienced Engineers and Managers developed a Technology for decentralized Environmentally friendly energy Production. The Module converts Heat from solar thermal Plants, the Combustion of Biomass or Waste heat from production and POWER Plant Processes into 50 KW of electricity and 400KW of thermal energy (in 80°C). The Novelties of the combined heat and power machine are the compact dimensions, the high Heat yield, the Use of Water as a non-toxic and non-explosive Medium-and that an Input Temperature of only 160°C is needed. This means that many Applications with renewable Energy sources or Measures to Increase Efficiency can be implemented in Processes.

With this innovative Technology, we will now enter the international Market. A developed Business Plan is available. To This end, we are happy to talk to potential Partners for pilot projects and Investors.
